About Byte Bulletin

ByteBulletin proudly presents a vibrant showcase of our department's milestones, capturing the spirit of learning, innovation, and excellence that defines our academic community. This edition highlights the enthusiastic participation of students in various co-curricular and extracurricular activities, along with their accomplishments in prestigious online courses and NPTEL certifications that reflect their commitment to continuous learning. The newsletter also celebrates the remarkable achievements of our dedicated faculty, whose contributions inspire academic growth and professional development. In addition, it features a comprehensive overview of department events, workshops, and initiatives, as well as notable student achievements and winners across diverse domains. ByteBulletin stands as a testament to our collective efforts, talent, and pursuit of excellence, offering readers an inspiring glimpse into the dynamic activities shaping our department.

DEPARTMENT ACTIVITIES

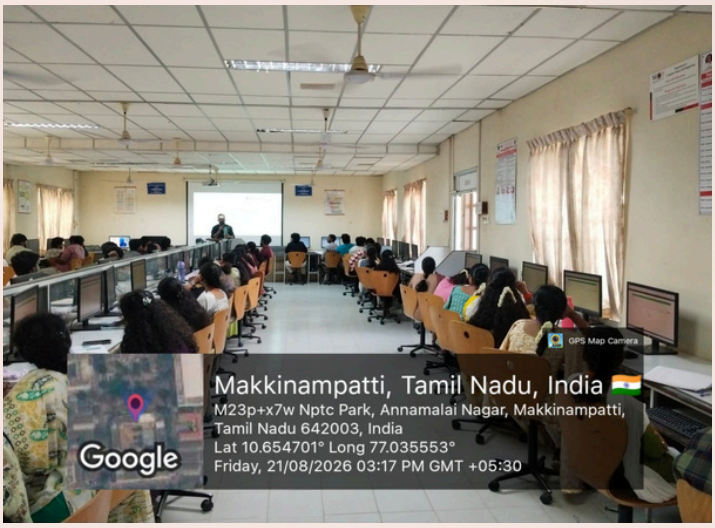
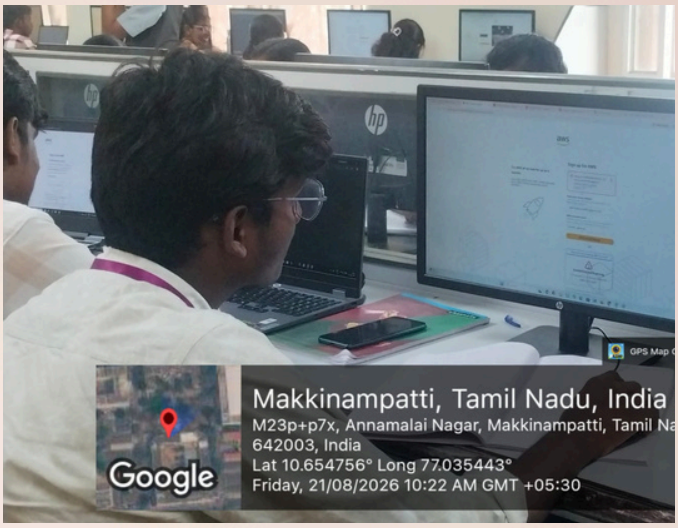
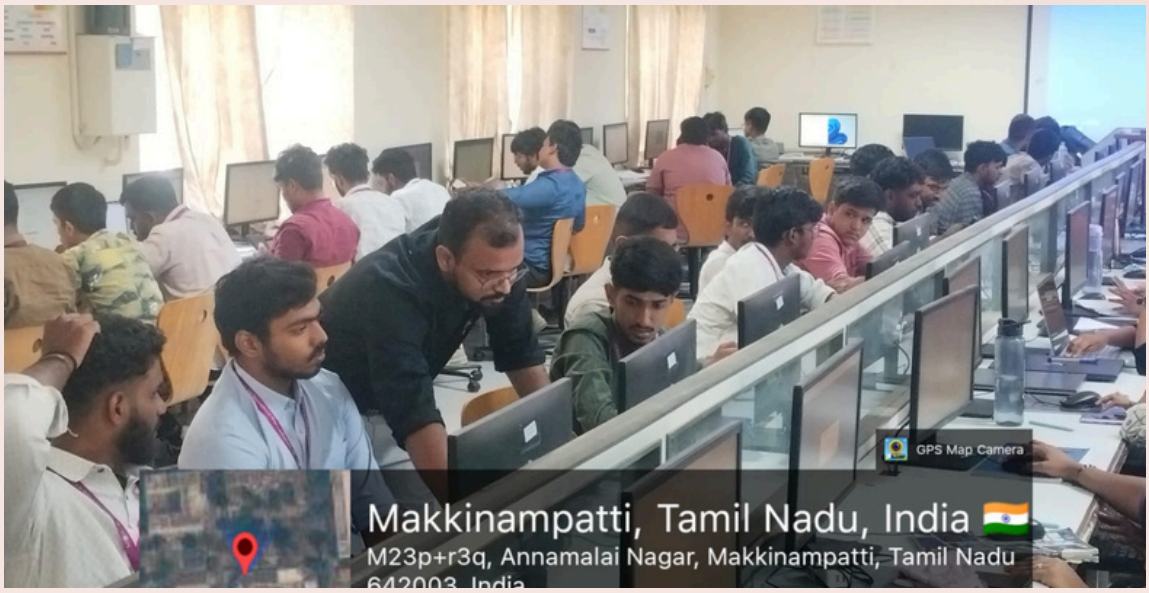
01) The Department of Computer Science and Engineering organized an informative **AWS Workshop** on 20.08.2026 & 21.08.2026 to introduce students to cloud computing and Amazon Web Services. The workshop included practical sessions and demonstrations, helping students gain hands-on knowledge of AWS services and understand their real-world applications







02) The Department of Computer Science and Engineering organized an informative **MongoDB Workshop on 13.08.2026 &14.08.2026** to introduce students to NoSQL databases and modern data management techniques. The workshop included practical sessions that helped students understand MongoDB concepts, database operations, and their real-world applications.

03) The Department of Computer Science and Engineering organized an informative **Docker and Kubernetes Seminar** on 28 August 2026 to introduce students to container orchestration and cloud-native technologies. The workshop provided students with practical exposure to Kubernetes concepts, container management, deployment, and real-world applications, enhancing their understanding of modern software development and cloud computing.

Abstract: Fake news detection focuses on identifying and preventing the spread of misleading or false information. It is crucial for maintaining the integrity of public discourse and protecting individuals from the harmful effects of misinformation. By ensuring the correctness and reliability of the information, the fake news detection hinders the loss of trust in the media, institutions, and public communication channels. The fake news detection systems suggested in the process of data acquisition where news stories are either manually or automatically retrieved from the net via web crawlers. The collected data later filters the information so it will use only credible sources. Phase two consists of the pre-processing phase using BERT, wherein the data will be tokenized and mapped into contextual embeddings that reflect the semantic meaning of words. Phase three is about engineering features using methods like TF-IDF and Word2vec to fine-tune the embeddings and label the important textual features. The final Phase of Classification occurs using the engineered features such that BERT-generated outputs are fine-tuned and passed through softmax functions to ascertain whether the news is fake or real. This holistic and all-encompassing approach integrates advanced natural language

Summary

Real-time data products must compress and denoise high-dimensional streams while meeting strict latency, memory, and bandwidth budgets. This chapter presents a practical blueprint for distributed and incremental PCA that delivers near baseline variance capture without repeated full factorizations. We specify a two-layer design in which local workers maintain mini batch updates with lightweight orthogonalization and forgetting, while a coordinator fuses compact summaries into a consistent global subspace with deterministic re-orthogonalization and versioned serving. The approach preserves sparsity, avoids dense covariance formation, and limits communication to quantities that scale with the target rank rather than with the feature dimension. We outline operational control step size schedules, QR cadence, oversampling, and power refresh triggers and show how anomaly-aware ingest, including statistical trimming and lightweight fuzzy gates, stabilizes the subspace under bursty or corrupted windows. A deployment-oriented evaluation plan compares explained variance, reconstruction error, principal angle drift, pass count, end-to-end latency, throughput, and communication per minute across centralized, sharded, and edge settings. The result is an implementation-ready recipe that couples rapid initialization with continuous tracking, providing accurate, low staleness representations for telemetry analytics, industrial monitoring, recommendation refresh, and cyber defense.

Abstract:
A hybrid Artificial Neural Network (ANN) and Genetic Algorithm (GA) model for effective energy management in solar smart lighting systems is presented in this paper. To improve system performance, the suggested model combines the optimization power of GA with the prediction power of ANN. Accuracy, precision, recall, F1-score, and energy efficiency are used to assess a variety of machine learning models, such as ANN, GA, Random Forest, and Support Vector Machine (SVM). With an accuracy of 96.8% and an energy efficiency of 97.5%, the hybrid ANN-GA model performs quite well. In order to minimize waste and increase sustainability, the system efficiently forecasts energy demand and optimizes power use in real time. This method works especially well for smart city applications when using renewable energy is essential. The findings show that decision-making and operational efficiency in solar-powered lighting systems are greatly improved by integrating learning and optimization approaches.

Abstract

Industrial Control Systems (ICS) and Supervisory Control and Data Acquisition (SCADA) networks play crucial roles in critical infrastructures in energy, water, and manufacturing industries. The convergence of Operational Technology with IoT has expanded the attack surface area, hence limiting the effectiveness of conventional intrusion detection approaches. Several machine learning-based SCADA intrusion detection systems rely on generic IT dataset inputs, protocol independent feature extraction methods, and inadequate adaptive alert-priority decisioning processes. This paper presents CyberShield, a three-layer adaptive SCADA intrusion detection approach. In the first layer, the paper employs an Adaptive Protocol-Aware Denoising Autoencoder (APDA) learns normal SCADA/ICS behaviour through group-wise parallel encoding based on dataset-specific semantic feature groups. APDA provides the latent embedding of the traffic z, per-group reconstruction errors, and global reconstruction error. In the second layer, a fusion of original features, APDA latent embedding z, and reconstruction error features results into a high-dimensional vector x', which is then classified using APDA guided XGBoost and LightGBM ensemble classifier. In the final layer, the paper uses statistical threshold $\tau = \mu + 3\sigma$ to determine Low, Medium, and High model-based alert-priority levels. CyberShield was tested on WUSTL-IIoT-2021 and HAI-21.03 datasets and obtained accuracy scores of 98.73% and 97.85%, Macro F1-scores of 98.70% and 97.76%, and AUC-ROC scores of 99.12% and 98.54%, respectively. It achieved higher measured performance than five reimplemented autoencoder and ensemble-based comparison methods. The results show that semantic-feature-group-aware representation learning, APDA-guided feature fusion, boosted ensemble classification, and adaptive alert-priority assignment improve SCADA anomaly detection and attack typing.

Abstract:

In this work, a hybrid system based on reinforcement learning is presented for autonomous pest identification and management in sustainable agriculture through the use of drone networks and the Internet of Things. To increase the effectiveness of pest control, the suggested approach combines machine learning methods with aerial surveillance and real-time environmental monitoring. Drones take high-resolution pictures to identify pests, while IoT sensors continually gather field data like temperature, humidity, and crop conditions. By optimizing decision-making for targeted pesticide application, a reinforcement learning algorithm minimizes resource waste and its negative effects on the environment. The model is compared to conventional methods such as CNN-based models, Random Forest, Support Vector Machine, and Logistic Regression. With an accuracy of 96.8% and an AUC of 98.0%, experimental data show that the suggested hybrid model performs better. By providing intelligent, automated, and scalable pest management solutions for modern farming systems, this method improves precision agriculture methods.
