

Dr. MAHALINGAM
COLLEGE OF ENGINEERING AND TECHNOLOGY

Udumalai Road, Pollachi, Coimbatore District - 642003

Established in 1998 ♦ Approved by AICTE ♦ Affiliated to Anna University

(A DIVISION OF NIA EDUCATIONAL INSTITUTIONS)

NAAC A++ GRADE
Cycle 3 (2023-2030)
The Highest Grade

Curriculum and Syllabi

M.E Communication systems

Semesters I to IV

Regulations 2024

Programme: M.E Communication systems
Curriculum and Syllabi: Semester I to IV
Recommended by Board of Studies on:09.05.2025
Approved by Academic Council on:04.07.2025

Action	Responsibility	Signature of Authorized Signatory
Designed and Developed By	BoS Electronics and Communication Engineering	
Compiled By	Office of Controller of Examination	
Approved By	Principal	

Dr. Mahalingam College of Engineering and Technology, Pollachi 642003.
(An autonomous institution approved by AICTE and affiliated to Anna University)

Department of Electronics and Communication Engineering

Vision

To strive for excellence in Electronics and Communication Engineering education, research and technological services imparting quality training to students, to make them competent and motivated engineers.

Mission

- Impart high quality technical education in Electronics and Communication Engineering through effective teaching- learning process and updated curriculum.
- Equip the students with professionalism and technical expertise to provide appropriate solutions to societal and industrial needs.
- Provide stimulating environment for continuously updated facilities to pursue research through creative thinking and team work.

Dr. Mahalingam College of Engineering and Technology, Pollachi 642003.
(An autonomous institution approved by AICTE and affiliated to Anna University)

Programme: M.E Communication systems

Programme Educational Objectives (PEOs) – Regulations 2024

After 2 to 3 years of completion of the programme the graduates will be able to:

PEO1. Exhibit the sustained knowledge in the field of Communication Systems and possess leadership capability in their professional careers.

PEO2. Develop optimal solutions to the needs of industry and society in the area of RF Communication systems and networking.

PEO3. Carryout research in multidisciplinary areas allied with Communication Engineering through lifelong learning

Programme Outcomes (POs) - Regulations 2024

On successful completion of M.E. Communication systems programme, graduating students/graduates will be able to:

PO1. Achieve widespread knowledge in Communication Systems with an ability to analyze and synthesize Communication Engineering and Networking

PO2. Write and present a substantial technical report/document for communicating the research findings.

PO3. Apply appropriate techniques and modern tools to analyze and test Communication systems

PO4. Practice professional ethics in multidisciplinary environment with a desire for life-long learning

Programme Specific Outcomes (PSOs) - Regulations 2024

On successful completion of M.E. Communication systems programme, graduating students/graduates will be able to:

PSO1: Provide feasible solutions to the problem in the areas of Microwave, RF Communication, Networking and Signal processing

PSO2: Develop Communication subsystems using recent techniques

SEMESTER I

Course Code: 24MAT103		Course Title: Linear Algebra and Stochastic Processes	
Course Category: FC		Course Level: Introductory	
L:T:P (Hours/Week) 3:1 :0	Credits: 4	Total Contact Hours:60	Max Marks:100

Course Objectives:

The course aims in illustrating the usage of mathematical tools like Linear algebra, Probability and stochastic process to facilitate deep understanding of the concepts related to telecommunication engineering.

Module I

22+8 Hours

Vector Spaces :Four fundamental vector spaces of the matrix - Rank- Nullity theorem- Projection theorem - Linear transformation matrix with different basis - Gram-Schmidt orthogonalization procedure - QR factorization- Eigen values and Eigen vectors- Diagonalization of the matrix - Schur's lemma. Hermitian Matrices - Unitary Matrices- Normal Matrices - Singular Value Decomposition

Probability Spaces : Random variables and random vectors - Distributions and densities - Conditional distributions and densities - Independent random variables - Transformation of random variables

Multiple Random Variables : Expectations — Indicator - Moment generating function- Characteristic function - Multiple random variables - Gaussian random vector - Co-variance matrix - Complex random variables - Sequence of random variables - Central limit theorem.

Module II

23+7 Hours

Random Walks and Other Applications

Random Walks - Poisson Points and Shot Noise - Modulation - Cyclostationary Processes –Band limited Processes and Sampling Theory - Deterministic Signals in Noise - Bispectra and System Identification -The Poisson Sum Formula - The Schwarz Inequality Problems.

Spectral Representation

Factorization and Innovations - Finite-Order Systems and State Variables - Fourier Series and Karhunen-Loeve Expansions - Spectral Representation of Random Processes - Problems.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1: Enhance Problem solving skills by solving problems in linear algebra	Apply
CO2: Solve the problem associated with transformation of random Variables-Application.	Apply
CO3: Apply the concepts associated with multiple random variable and solve the problems associated with Multivariate Gaussian random vector-Comprehension.	Apply
CO4: Apply the basic concepts in random process for application such as random signals, linear system in communication engineering.	Apply
CO5: Apply the knowledge of spectral representation of random process in telecommunication engineering.	Apply

Course Code: 24COT101	Course Title: Advanced Digital Signal Processing		
Course Category: PCC		Course Level: Mastery	
L:T:P(Hours/Week) 3: 1: 0	Credits:4	Total Contact Hours: 60	Max Marks: 100

Course Objectives:

The course is intended to impart knowledge on stationary models, parametric and non-parametric methods of power spectrum estimation, designing of filters for linear prediction, principles of adaptive filters and concept of multirate signal processing.

Module I

30 Hours

Stationary models: Random signal modeling, MA(q), AR(p), ARMA(p,q) models, Hidden markov model and its applications, Linear system with random input, Forward and Backward predictions, Levinson durbin Algorithm.

Spectral Estimation: Non Parametric methods, Periodogram, Modified Periodogram, Bartlett, Welch and Blackman Tukey methods, Parametric methods, Auto Regressive (AR) spectrum estimation, Moving Average and Auto Regressive Moving average spectrum Estimation.

Module II

30 Hours

Linear Prediction: Linear Prediction and Optimum linear Filters, Forward-Backward linear prediction filters, Solution of normal equations, AR Lattice and ARMA lattice, Ladder filters, Wiener filters.

Adaptive Filtering: Gradient and Minimum Mean Square error, Method of steepest descent, LMS Algorithm, RLS algorithm, Kalman filter, Extended Kalman filter.

Multirate Signal Processing: Decimators and Interpolators, Sampling rate conversion, Multistage decimator & interpolator, polyphase filters, QMF filter banks, Subband Coding Application.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Apply the concepts of stationary models in signal processing applications.	Apply
CO 2: Apply the parametric and Non parametric methods for estimating spectra in real life problems.	Apply
CO 3: Design Adaptive Stochastic Polyphase Filters and analyze the concept in real time applications.	Analyze

Course Code: 24COT102	Course Title: Wireless Broad band Networks		
Course Category: PCC		Course Level: Mastery	
L:T:P(Hours/Week) 3:0:0	Credits:3	Total Contact Hours:45	Max Marks:100

Course Objectives:

The course is intended to impart knowledge on wireless network infrastructure, Wireless protocols, layer level functions and emerging trends in wireless broadband networks.

Module I

22 Hours

Wireless Protocols: Mobile network layer- Fundamentals of Mobile IP, data forwarding procedures in mobile IP, IPv4, IPv6, IP mobility management, IP addressing - DHCP, Mobile transport layer-Traditional TCP, congestion control, slow start, fast recovery/fast retransmission, classical TCP improvements-Indirect TCP, snooping TCP, Mobile TCP

3G Evolution: IMT-2000 - W-CDMA, CDMA 2000 - radio & network components, network structure, packet-data transport process flow, Channel Allocation, core network, interference-mitigation techniques,

UMTS-services, air interface, network architecture of 3GPP, UTRAN — architecture, High Speed Packet Data-HSDPA

Module II

23 Hours

4G Evolution: Introduction to LTE-A — Requirements and Challenges, network architectures EPC, E- UTRAN architecture - mobility management, resource management, services, channel-logical and transport channel mapping, downlink/uplink data transfer, MAC control element, PDU packet formats, scheduling services, random access procedure.

Layer-Level Functions: Characteristics of wireless channels - downlink physical layer, uplink physical layer, MAC scheme -frame structure, resource structure, mapping, synchronization, reference signals and channel estimation, SC-FDMA, interference cancellation — CoMP, Carrier aggregation, Services - multimedia broadcast/multicast, location-based services.

5G Evolution: 5G Roadmap - Pillars of 5G - 5G Architecture

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Apply the knowledge to optimize wireless network infrastructure for different environments and applications.	Apply
CO 2: Analyze and implement layer level functions in broadband networks.	Analyze
CO 3 : Analyze emerging trends and technologies in the wireless broadband industry.	Analyze
CO 4: Evaluate various wireless communication standards and protocols.	Evaluate

Course Code: 24CCT101	Course Title: Research Methodology and IPR		
Course Category: RMC		Course Level: Mastery	
L:T:P(Hours/Week) 3:0:0	Credits: 3	Total Contact Hours: 45	Max Marks:100

Course Objectives:

The course is intended to impart knowledge on various research types and problem identification. It emphasizes selecting experiment designs, data types, tools, and data analysis processes. Additionally, it covers interpreting and presenting results effectively. The syllabus also delves into intellectual property rights, including types and procedures, and provides hands-on experience in executing patent filing and licensing.

Module I

22 Hours

Overview of Research Methodology

Research methodology – definition, mathematical tools for analysis, Types of research, exploratory research, conclusive research, modeling research, algorithmic research, Research process. Data collection methods- Primary data – observation method, personal interview, telephonic interview, mail survey, questionnaire design. Secondary data- internal sources of data, external sources of data.

Attitude measurements, Scales and Sampling methods

Scales – measurement, Types of scale – Thurstone’s Case V scale model, Osgood’s Semantic Differential scale, Likert scale, Q- sort scale. Sampling methods- Probability sampling methods – simple random sampling with replacement, simple random sampling without replacement, stratified sampling, cluster sampling. Non- probability sampling method – convenience sampling, judgment sampling, quota sampling.

Module II

23 Hours

Hypotheses testing

Hypotheses testing — Testing of hypotheses concerning means (one mean and difference between two means -one tailed and two tailed tests)

Report Writing and Presentation

Report writing- Types of report, guidelines to review report, typing instructions, oral presentation

Patenting

Nature of Intellectual Property: Patents, Designs, Trade and Copyright. Process of Patenting and Development: technological research, innovation, patenting, development. International Scenario: International cooperation on Intellectual Property. Procedure for grants of patents, Patenting under PCT.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1. Describe the overview of research methodology	Understand
CO 2. Explain the attitude measurements, scales and sampling methods	Understand
CO 3. Apply hypotheses testing in research problem	Apply
CO 4. Elucidate the research report writing and presentation effectively	Understand
CO 5: Apply patent and copyright for their innovative works	Apply

Course Code: 24COL101		Course Title: VLSI and Wireless Communication Laboratory	
Course Category: EEC		Course Level: Mastery	
L:T:P(Hours/Week):0:0:4	Credits:2	Total Contact Hours:60	Max Marks:100

Course Objectives:

The course is intended to impart knowledge on simulation tool such as CADENCE, or other relevant software, for designing and analyzing various Electronic circuits and engage students in the design, implementation, and testing of various circuits such as LNA, Mixer, PLL, VCO and data converters.

List of Experiments:

1. Design a LNA for given specifications. Perform DC and transient analysis.
2. Design Gilbert mixer for given specifications. Perform DC and transient analysis using Cadence EDA tool.
3. Design PLL for given specifications perform analysis using Cadence EDA tool.
4. Design VCO for given specifications perform analysis using Cadence EDA tool.
5. Design Ring oscillator and show the effect of stage variation on the output frequency.
6. Design a transreceiver front end and perform impedance matching at layout level.
7. Design a CMOS A/D converter for data communication application.
8. Design a CMOS D/A converter for data communication application.

Simulation tools to be used: CADENCE EDA and other relevant open source tools

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Design and analyze the performance of various electronic circuits such as LNA, Mixer, PLL, VCO and Ring oscillator.	Analyze
CO 2: Design the front end of a transceiver and analyze its performance for impedance matching at layout level.	Create
CO 3: Design and evaluate the performance of CMOS converters for data communication.	Analyze

2. <https://archive.nptel.ac.in/courses/117/102/117102062/>

Course Code: 24COL102		Course Title: Advanced Communication Networks Laboratory	
Course Category: EEC		Course Level: Mastery	
L:T:P(Hours/Week) 0:0 :4	Credits:2	Total Contact Hours:60	Max Marks:100

Course Objectives:

The course is intended to impart knowledge on configuring networks and Analyzing the various TCP congestion control mechanisms using necessary tools and to engage students in the configuration of various Networks.

List of Experiments:

1. Study of Networking Commands (Ping, Tracert, TELNET, nslookup, netstat, ARP, RARP) and Network Configuration Files.
2. Linux Network Configuration.
 1. Configuring NIC's IP Address
 2. Determining IP Address and MAC Address using if-config command
 3. Changing IP Address using if-config
 4. Static IP Address and Configuration by Editing
 5. Determining IP Address using DHCP
 6. Configuring Hostname in /etc/hosts file
3. Configuration of IP addressing for a given scenario for a given set of topologies
4. Performance Evaluation of TCP Congestion control Mechanisms
5. Simulation of Resource reservation Protocol (RSVP).
6. Network design and testing using simulation tools.
7. Simulation of Queuing and Scheduling algorithms.
8. Configure DHCP server and DHCP clients.
9. Configure DNS: Make a caching DNS client, and a DNS Proxy; implement reverse DNS and forward DNS.
10. Perform a case study about the different routing algorithms to select the network path with its optimum and economical during data transfer.

Simulation tools to be used: Networking tools (open source)

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Build and evaluate the performance of Linux network and IP addressing for a given scenario for a given set of topologies.	Create
CO 2: Simulate and evaluate the performance of various network protocols and algorithms for a given scenario.	Evaluate
CO 3 : Analyze the performance of different routing algorithm for optimum data transfer with case study.	Analyze

Course Code: 24SHA101	Course Title: English for Research Paper Writing (Common to all PG Programme)		
Course Category :AC	Course Level : Introductory		
L:T:P(Hours/Week)2:0:0	Credits: -	Total Contact Hours: 30	Max Marks: 100

Course Objectives:

The course is intended to enhance the language skills concerning research paper writing and to explain the crucial role of technology in enhancing the quality and credibility of research.

Module I

15 hours

Foundations of Academic English in Research: Academic English - Key Language Aspects - Clarity and Precision - Objectivity - Formal Tone - Integrating References.

Effective Writing Style for Research Papers: Word Order - Sentences and Paragraphs - Link Words for Cohesion - Avoiding Redundancy / Repetition - Breaking up long sentences - Paraphrasing Skills.

Advanced Reading and Research Vocabulary Development: Critical Reading Strategies - Analysing Research Articles - Identifying Arguments - Evaluating Findings - Formulaic Expressions - Academic Phrase Bank - Discipline-Specific Vocabulary - Commonly Misused Words.

Module II

15 hours

Presentation Language Skills: Written vs. Spoken English - Dynamic Vocabulary for Presentations - Expressive Language for Audience Engagement - Language for Clear and Impactful Slides - Adapting Language Style to Different Audiences.

Grammar Refinement for Research Writing: Advanced Punctuation Usage - Proper Use of Modifiers - Avoiding Ambiguous Pronoun References - Verb Tense Consistency - Conditional Sentences.

Technology and Language for Research: Technology and Role of AI in Research Writing - Citations and References - Plagiarism and Ethical Considerations - Tools and Awareness - Fair Practices.

Course Outcomes:	Cognitive Level
At the end of the course the student will be able to:	
CO1: Enhance their English Language Skills concerning research paper writing	Understand
CO2: Develop a comprehensive set of linguistic skills essential for academic research.	Apply
CO3: Produce well-structured research papers using a variety of research and presentation technologies.	Apply

Assessment Pattern

	Assessment Component	CO. No.	Marks	Total
Continuous Comprehensive Evaluation(Internal)	Assignment 1	1	20	100
	Assignment 2	2	20	
	Assignment 3	3	20	
	MCQ	1,2,3	20	
	Descriptive Pattern Test	1,2,3	20	

Student will be finally awarded with three levels based on the score as follows:

Marks Scored	Levels
70% & above	Good
30-69 %	Average
< 30 %	Fair

SEMESTER II

Course Code: 24COT201	Course Title: Advanced Antenna Design Technologies		
Course Category: PCC		Course Level: Mastery	
L:T:P(Hours/Week) 3:0:0	Credits:3	Total Contact Hours:45	Max Marks:100

Course Objectives:

Empower students with essential antenna engineering skills, encompassing radiation mechanisms, array analysis, special antennas, microstrip antennas, smart antennas, and radio wave propagation modes, fostering hands-on design expertise

Module I

22 Hours

Aperture Antennas: Antenna Radiation Mechanism- Huygens' principle – radiation from rectangular and circular apertures – design considerations – Babinet's principle – Radiation from Sectoral and pyramidal horns – design concepts- prime-focus parabolic reflector and Cassegrain antennas.

Array Antenna Design Techniques: Analysis of uniformly spaced arrays with uniform and non-uniform excitation amplitudes – extension to planar Arrays-Phased array antenna

Microstrip Antenna Design Techniques: Basic characteristics of microstrip antennas– feeding Methods-Design of rectangular patch antennas – Planar Inverted-F Antenna (PIFA), Design of microstrip patch antenna using relevant software for given applications.

Module II

23 Hours

Special Antennas and Design Techniques: Frequency Independent antennas-LPDA, Antenna miniaturization, Fractal antennas, Broadband Antennas-Helical Antenna-Bandwidth Improvement techniques.

Smart Antennas Design: Applications of Smart Antenna - Analog Beam Forming-Digital Beam forming- Direction of Arrival Estimation Methods-Diversity Combining Techniques- Digital radio receiver techniques and software radio for smart antenna

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Analyze the parameters and design concepts of Aperture Antennas.	Analyze
CO 2: Analyze the parameters and design concepts of Array Antenna	Analyze
CO 3: Investigate the techniques and methods to improve antenna performance.	Analyze
CO 4: Identify the suitable antenna for given application	Apply
CO 5: Involve in independent/team learning and use Modern tools to design antenna for practical applications	Create

Course Code: 24COT202	Course Title: Signal Detection and Estimation Theory		
Course Category: PCC		Course Level: Mastery	
L:T:P(Hours/Week) 3: 0: 0	Credits:3	Total Contact Hours: 45	Max Marks: 100

Course Objectives:

The course is intended to impart knowledge on the application of statistical hypothesis testing for the detection of signals in noise, exploring the detection of multiple signals with unknown parameters. It aims to familiarize students with statistical parameter estimation methods to extract information from signals in noise and to summarize the application of filtering in the signal detection and estimation process.

Module I

22 Hours

Signal Detection: Review of random variables and processes, review of vector space and vector-space interpretation of random variables, problem formulation and objectives of signal detection and signal parameter estimation in discrete-time domain. **Statistical Decision Theory:** Bayesian, minimax, and Neyman-Pearson decision rules, likelihood ratio test (LRT), receiver operating characteristics, composite hypothesis testing, locally optimum tests, generalized LRT, detector comparison techniques, asymptotic relative efficiency. **Detection of Deterministic Signals:** Matched filter detector and its performance, generalized matched filter, detection of sinusoid with unknown amplitude, phase, frequency and arrival time, linear model. **Detection of Random Signals:** Estimator-correlator, linear model, general Gaussian detection, detection of Gaussian random signal with unknown parameters, weak signal detection. **Nonparametric Detection:** Detection in the absence of complete statistical description of observations, sign detector, Wilcoxon detector, detectors based on quantized observations, robustness of detectors.

Module II

23 Hours

Signal Estimation: Estimation of Signal Parameters - Minimum variance unbiased estimation, Fisher information matrix, Cramer-Rao bound, sufficient statistics, minimum variance unbiased estimation, complete statistics, linear models; best linear unbiased estimation, maximum likelihood estimation, invariance principle; estimation efficiency, Bayesian estimation: philosophy, nuisance parameters, risk functions, minimum mean square error estimation,

maximum a posteriori estimation. **Signal Estimation in Discrete-Time:** Linear Bayesian estimation, Weiner filtering, dynamical signal model, discrete Kalman filtering.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Use the statistical information in basic detection theory to solve the problems that involve detection of signals in the presence of real time noise.	Apply
CO 2: Detect multiple types of signals (deterministic signals, random signals, and signal with unknown parameters).	Analyze
CO 3: Design optimal estimators for various signal parameters.	Create
CO 4: Develop optimal filters and Wiener/Kalman filters for the given specifications in communication applications.	Evaluate

Course Code: 24COT203	Course Title: 5G : Features, Standards and Evolution		
Course Category: PCC		Course Level: Mastery	
L:T:P(Hours/Week) 3: 0: 0	Credits: 3	Total Contact Hours: 45	Max Marks: 100

Course Objectives:

The course is intended to impart knowledge on essential principles of 5G communications, 5G architecture and 5G internet, 5G spectrum, cognitive networks of 5G.

Module I

22 Hours

History of 5G: Historical background, 5G use cases and system concept: Use case requirements, 5G system concept.

The 5G Architecture: Introduction, High-level requirements for the 5G architecture, Functional architecture and 5G flexibility, Physical architecture and 5G deployment.

Machine-type communications: Introduction, Fundamental techniques for MTC, Massive MTC, Massive MTC, Summary of uMTC features.

Device to Device (D2D) communications: From 4G to 5G, Radio resource management for mobile broadband D2D, Multi-hop D2D communications for proximity and emergency services, Multi operator D2D communication.

The 5G radio-access technologies: Access design principles for multi-user communications, Multi-carrier with filtering: a new waveform, Non-orthogonal schemes for efficient multiple access.

Module II

23 Hours

Radio access for dense deployments, Radio access for V2X communication, Radio access for massive machine-type communication.

Relaying and wireless network coding: The role of relaying and network coding in 5G wireless networks, Multi-flow wireless backhauling, Highly flexible multi-flow relaying, Buffer-aided relaying.

Interference management, mobility management and dynamic: Network deployment types, Interference management in 5G. Mobility management in 5G, Dynamic network reconfiguration in 5G

Spectrum: Introduction, 5G spectrum landscape and requirements, Spectrum access modes and sharing scenarios, 5G spectrum technologies, Value of spectrum for 5G: a techno-economic perspective.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Describe the concepts of 5G networks and its architecture.	Understand
CO 2: Analyze the spectrum optimization using cognitive radio in 5G network.	Apply
CO 3: Analyze the white space spectrum opportunities and challenges.	Analyze
CO 4: Analyze the security issues and challenges in 5G communication systems.	Create

Course Code: 24COL201		Course Title: RF System Design Laboratory	
Course Category: EEC		Course Level: Mastery	
L:T:P(Hours/Week) 0:0 :4	Credits:2	Total Contact Hours:60	Max Marks:100

Course Objectives:

The course is intended to impart knowledge on designing and analyzing RF/microwave components and wireless systems using modern tools and engage students to gain hands-on experience with measurement and communication technologies tools.

List of Experiments:

1. Simulation of Planar Transmission Lines and matching network
2. Design and Simulation of Microwave Filters
3. Design and Simulation of Microstrip Couplers
4. Design and Simulation of Power dividers using ADS
5. Design and Simulation of Patch antenna for ISM Band
6. Simulation of RF Mixer Circuit
7. Design and Simulation Low noise amplifier
8. Simulation of RF Transceiver
9. Measurement of Microwave Devices and Antennas using VNA
10. Simulation and performance evaluation of Wireless MAC protocols.
11. Study of ZIGBEE/Bluetooth
12. Study of Global Positioning System

Simulation tools to be used: ADS & Networking tools (open source)

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Design, simulate and Measure the performance of RF circuits, antenna and RF subsystems.	Create
CO 2: Analyze the performance of various communication systems.	Analyze

Reference Book(s):

R1. Lab Manual prepared by the faculty members of ECE Department

1. <https://nptel.ac.in/noc/courses/noc17/SEM1/noc17-ec03/>

Course Code: 24COL202		Course Title: Research Paper Seminar	
Course Category: Professional Core		Course Level: Practice	
L:T:P(Hours/Week) 0:0:2	Credits: 1	Total Contact Hours: 30	Max Marks: 100

Course Objective:

The course is intended to develop critical analysis, presentation, and research communication skills by engaging students in the study, review, and presentation of contemporary research papers in the field of Electronics and Communication Systems.

Assessment Methodology:

1. Internal Assessment: 75 Marks
 - Three Reviews – Each carrying 25 marks (3 × 25 = 75 marks)
2. Final Review: 25 marks

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1: Analyze research papers and identify key contributions, methodologies, and limitations in the context of recent advancements in the research domain.	Analyze
CO2: Communicate technical content with clarity, demonstrate depth of understanding, and actively participate in scholarly discussions	Apply

Course Code: 24SHA201	Course Title: Teaching and Learning in Engineering (common to all PG Programmes)		
Course Category: AC	Course Level: Introductory		
L:T:P(Hours/Week) 0:0:4	Credits: -	Total Contact Hours: 30	Max Marks:100

Course Objectives:

The course is intended to impart knowledge on an outcome-based approach, employing active learning methods in lecture/practical/tutorial sessions. Assessments will be conducted using rubrics, focusing on higher-order thinking skills.

Module I

15 Hours

Outcome Based Approach

Outcome based Education- Need & Approach- Washington accord- Graduate attributes- Learning outcomes –Blooms Taxonomy.

Active Learning Methods

Design and Delivery plan for lectures/practical/tutorial sessions-Need for Active learning methods-Active learning strategies- Benefits of Active learning Methods.

Module II

15 Hours

Assessments

Assessments- types of assessments-need for rubrics, Types of rubrics- Assessment using rubrics.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1: Use outcome based approach in teaching courses in Engineering Programmes.	Apply
CO2: Conduct lecture/practical/tutorial sessions using active learning methods.	Apply
CO3: Conduct higher order assessments by using rubrics.	Apply

SEMESTER III

Course Code: 24COP301		Course Title: Project - I	
Course Category: Project		Course Level: Mastery	
L:T:P(Hours/Week) 0:0:20	Credits: 10	Total Contact Hours: 150	Max Marks: 200

Course Objective:

The objective of this course is to enable students to initiate independent research by defining a relevant problem statement, conducting a comprehensive literature review, and examining existing methodologies. The course further aims to strengthen analytical, technical, and problem-solving skills through the implementation and evaluation of a baseline system, thereby preparing students for the subsequent phases of their research project.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1:Identify a research problem, critically review relevant literature, and formulate well-defined research objectives in alignment with current trends and technological advancements	Analyze
CO2:Implement and assess an existing system or methodology, analyze its performance, and identify potential gaps or areas for further research.	Evaluate

SEMESTER IV

Course Code: 24COP401		Course Title: Project - II	
Course Category: Project		Course Level: Mastery	
L:T:P(Hours/Week) 0:0:32	Credits: 16	Total Contact Hours: 240	Max Marks: 400

Course Objective:

The objective of this course is to enable students to design, develop, and implement innovative solutions for a chosen problem, evaluate results using suitable methodologies, and communicate their findings effectively through technical reports and presentations, thereby preparing them for professional practice or further research.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1: Develop comprehensive solutions to a defined engineering problem by employing suitable tools, technologies, and methodologies.	Create
CO2: Analyze, interpret, validate results, and effectively communicate the research outcomes through systematic documentation and professional oral presentations.	Evaluate

PROFESSIONAL ELECTIVES

Course Code: 24COE001	Course Title: Satellite Communication and Navigation Systems		
Course Category: PEC	Course Level: Mastery		
L:T:P(Hours/Week) 3:0:0	Credits: 3	Total Contact Hours: 45	Max Marks: 100

Course Objectives:

The course is intended to impart knowledge on basic principles of satellite and navigation systems, classification of satellites, orbital parameters and launch vehicles.

Module1

22 Hours

Satellite Architecture and Orbital analysis: Architecture of Satellite Communication System: Principles and architecture of satellite Communication, Brief history of Satellite systems, advantages, disadvantages, applications, and frequency bands used for satellite communication and their advantages/drawbacks. Orbital equations, Kepler's laws of planetary motion, Apogee and Perigee for an elliptical orbit, evaluation of velocity, orbital period, angular velocity of a satellite, concepts of Solar day and Sidereal day.

Satellite Launch and In-orbit Operations: Acquiring the Desired Orbit, Launch Sequence, Orbital Perturbations, Satellite Stabilization, Orbital Effects on Satellite's Performance, Look Angles of a Satellite, Earth Coverage and Ground Tracks.

Satellite Hardware: Satellite Subsystems, Mechanical Structure, Propulsion Subsystem, Thermal Control Subsystem, Power Supply Subsystem, Attitude and Orbit Control, Tracking, Telemetry and Command Subsystem, Payload, Antenna Subsystem, Space Qualification and Equipment Reliability.

Module II

23 Hours

Earth Station: Types of Earth Station, Earth Station Architecture, Earth Station Design Considerations, Earth Station Testing, Earth Station Hardware, Satellite Tracking.

Satellite Link Design Fundamentals : Transmission Equation, Satellite link parameters, Frequency Considerations, Propagation Considerations, Techniques to Counter Propagation Effects, Noise Considerations, Interference-related Problems, Antenna Gain-to-Noise Temperature (G/T) Ratio, Link Design.

Radar and GPS : Basic Radar, Radar Block Diagram, The simple form of the Radar Equation, Radar Frequencies, Application of radar, Types of Radars, Probability of Detection and False alarm. Global Navigation Satellite Systems, Basic concepts of GPS, Space segment, Control segment, user segment, GPS constellation, GPS measurement characteristic.

Navigation systems: Introduction and Classification of Wireless Positioning Systems, positioning and navigation systems.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Explain various Orbital Parameters, Satellite Link Parameters and Propagation considerations.	Understand
CO 2: Apply the concepts of radars, WLAN and satellites in determining the user position and navigation	Apply
CO 3: Analyze Orbital Mechanics, TT&C and other design issues	Analyze
CO 4: Design basic satellite link system for Uplink and Downlink and evaluate C/N overall for the link.	Create

Course Code: 24COE002		Course Title: Modern Wireless Communication	
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3: 0: 0	Credits:3	Total Contact Hours:45	Max Marks:100

Course Objective:

The course is intended to impart knowledge of modern wireless communication systems such as Mobile, Cellular systems, 5G etc.

Module I

23 Hours

Wireless Systems: Wireless vision - Technical Issues- current wireless systems: Cellular Telephone Systems -Cordless Phones-Wireless LANs-Wide Area Wireless Data Services - Broadband Wireless Access-Paging Systems -Satellite Networks-Low-Cost Low-Power Radios: Bluetooth and Zigbee- Ultra wideband Radios-The Wireless Spectrum: Methods for Spectrum Allocation-Spectrum Allocations for Existing Systems.

Cellular System Design: Frequency Reuse, channel assignment strategies, handoff Strategies, Interference and system capacity, tracking and grade off service, improving coverage and capacity.

Wireless Channel Capacity: Capacity in AWGN-Capacity of Flat-Fading Channels - Capacity of Frequency-Selective Fading Channels: Time-Invariant Channels -Time-Varying Channels.

Module II

22 Hours

Intelligent Cellular and Its Application: Intelligent cell concept, applications of intelligent micro- cell Systems, in-Building Communication and CDMA cellular Radio Networks.

Higher Generation Cellular Standards: Review of 2G Standards,3G Standards: evolved

EDGE, enhancements in 4G standard, Architecture and representative protocols, call flow for LTE, VoLTE, UMTS, Introduction to 5G

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Describe the operation of various wireless communication systems	Understand
CO 2: Analyze the Capacity of Time varying and Time Invariant Channels for Flat Fading and Frequency Selective Fading.	Analyze
CO 3: Apply the intelligent cell concept for modern mobile communication techniques like VoLTE and 5G	Apply

Course Code: 24COE003	Course Title: Massive MIMO and Beam forming Techniques		
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3:0:0	Credits:3	Total Contact Hours:45	Max Marks:100

Course Objectives: To understand the performance of MIMO system in 4G/5G wireless communications. This course covers the fundamentals of Multiple input multiple output (MIMO) antenna based wireless communication systems. MIMO is now an essential part of modern wireless communication systems, such as 3G, 4G, WLAN / Wifi, LTE, WiMax, etc.

Module I

22 Hours

Diversity-multiplexing trade-off, transmit diversity schemes, advantages and applications of MIMO systems, Uncorrelated, fully correlated, separately correlated and keyhole MIMO fading models, parallel decomposition of MIMO channel. Uniform, adaptive and near optimal power allocation, Capacity for deterministic and random MIMO channels, Capacity of i.i.d., separately correlated and keyhole Rayleigh fading MIMO channels, Beam forming and its types.

Module II

23 Hours

Advantages, code design criteria, Alamouti space-time codes, SER analysis of Alamouti space-time code over fading channels, Space-time block codes, Space-time trellis codes, Performance analysis of Space-time codes over separately correlated MIMO channel, Space-time turbo codes. ML, ZF, MMSE, ZF-SIC, MMSE-SIC, LR based detection, Spatial modulation, MIMO based cooperative communication and cognitive radio, multiuser MIMO, cognitive-femtocells and large MIMO systems for 5G wireless.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Understand the basic concept of antenna diversity schemes	Understand
CO 2: Analyze the signal processing of MIMO in 4G LTE Communication	Analyze
CO 3: Compare the channel capacity of MIMO system under different channel conditions	Analyze
CO 4: Analyze the problems related to Alamouti coding and BLAST structure of MIMO system.	Analyze
CO 5: Analyze the Massive MIMO environment in 5G systems.	Analyze

Course Code: 24COE004	Course Title: Next Generation Mobile Communication Technologies		
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3:0 :0	Credits:3	Total Contact Hours: 45	Max Marks:100

Course Objectives:

The course is intended to impart knowledge on the evolution of the mobile technology, future trends of 6G technology, Regulatory and Standardization Aspects. It also helps students to critically assess current mobile communication technologies, understand the potential and challenges of future developments, and apply their knowledge in practical and theoretical contexts.

Module I

22 Hours

Past and Present Communication Technologies: Introduction to Wireless Personal Communication, Mobile radio systems, Modulation schemes for wireless Communication (MSK, GMSK), OFDM. Multiple access techniques: Spread spectrum techniques, Cellular CDMA, Wide-band CDMA, Multiple access Performance of CDMA, Capacities of multiple access schemes, Comparison, NOMA. Wireless Networks and Standards: GSM, CDMA Cellular standard, 3G, 4G, Introduction to 5G, The challenges of 5G; Key technologies of 5G; Design issues for 5G; Spectrum, regulation and standardization for 5G, 5G Networks Towards Smart and Sustainable Cities

Module II

23 Hours

Leap to 6G: The 6G vision, Sub 6 GHz communication- The capacity problem, Technologies enabling 6G — Millimeter wave and Terahertz communications: Abundance of bandwidth, Free space path loss problem of Millimeter and Terahertz waves, Propagation ,Attenuation and losses, Visible light Communications, Multiplexing and channel access methods for 5G and 6G, Role of Artificial intelligence in 6G, edge computing, Licensing and Regulation challenges in 6G, privacy and security concerns, 6G-Green network,6G Research Areas

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1: Demonstrate a thorough understanding of the progression from early mobile communication systems (1G) to the latest technologies (5G) and potential future developments (6G).	Apply
CO2: Experiment the emerging trends and technologies, such as IoT, edge computing, and AI integration in mobile networks, and predict their potential impacts.	Analyze
CO3: Investigate independent research and contribute to advancements in the field of mobile communications, presenting findings through reports, presentations, or publications.	Create
CO4: Work effectively in teams to design and develop mobile communication solutions, and communicate technical information clearly to both technical and non-technical audiences.	Create

Course Code: 24COE005		Course Title: IoT for Wireless Networks	
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3:0:0	Credits: 3	Total Contact Hours:45	Max Marks: 100

Course Objectives:

The course is intended to impart knowledge on concepts of Internet of Things (IoT) protocols and its applications, IoT security & system management framework.

Module I

22 Hours

Introduction and Applications: Introduction to IoT — Definition, Characteristics, functional requirements, motivation, Physical design - things in IoT, IoT protocols, Logical Design - functional blocks, communication models, Communication APIs, Applications — Home Automation, Cities, Environment, Energy, Agriculture, Health, Industry

IoT Design and System Management: IoT &M2M — Machine to Machine, Difference between IoT & M2M, Software Defined Network, Network function virtualization, IoT system management — SNMP, NETCONF, YANG, IoT Design methodology.

IoT Protocols: Protocols – HTTP, UPnP, CoAP, MQTT, XMPP.

Module II

23 Hours

IoT System: IoT systems logical design using python - python data types & data structures, control flow, functions or modules. Modules & package of python, python packages of interest for IoT-JSON, XML, HTTP & URL Lib, SMTP Lib. Exemplary Device: Raspberry Pi- Programming Raspberry Pi with Python.

IoT Cloud and Data Analytics: Introduction to Cloud storage Models — WAMP — Xively Cloud for IoT – Python Web Application Framework-Django – Designing a RESTful based Web API. Data Analytics for IoT – Apache Hadoop, Apache Oozie.

IoT Security: IoT attacks - Phase attacks, Attacks as per architecture, Attacks based on components. Security Protocols - Time-Based Secure Key Generation and Renewal - Security access algorithms for unidirectional data transmissions, Security access algorithms for bidirectional data transmissions.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Interpret the vision of IoT from a global context.	Analyze
CO 2: Compare and Contrast the use of Devices, Gateways and Data Management in IoT.	Analyze
CO 3: Design a portable IoT using any Single Board Computer and relevant protocols	Apply
CO 4: Analyze applications of IoT in real time scenario	Analyze
CO 5: Deploy an IoT application and connect to the cloud.	Apply

Course Code: 24COE006		Course Title: Wireless Network Security and Privacy	
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3:0 : 0	Credits:3	Total Contact Hours:45	Max Marks:100

Course Objectives:

The course is intended to impart knowledge to identify and mitigate security threats, protect user privacy, and implement robust security policies and practices in wireless network.

Module I

22 Hours

Network Security and Management: Principles of cryptography –Security in wireless local area network – Overview of security architecture for wireless sensor network- Security in RFID networks and communications- IOT security.

DoS-attacks and counter measures – security in many layers. Infrastructure for network management – The internet standard management framework – SMI, MIB, SNMP, Security and administration – ASN.1. Case Study - Kali Linux

Module II

23 Hours

Wireless Security: Wi-Fi Security: Attacks on wireless networks, Security in the IEEE 802.11 standard, Security in 802.11i - security architecture, security policy negotiation. Authentication in wireless networks - RADIUS. Layer 3 security mechanisms - PKI, level 3 VPN. Security in Mobile Telecommunication networks - signaling, vulnerabilities of SS7, possible attacks on SS7, Security in GSM - security flaws.

Privacy and Storage Security: Privacy on the Internet - Privacy Enhancing Technologies - Personal privacy Policies - Detection of Conflicts in security policies- privacy and security in environment monitoring systems. Storage Area Network Security - Storage Area Network Security Devices - Risk management - Physical Security Essentials.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Implement the network management frame work for various attacks.	Apply
CO 2: Apply the knowledge of Privacy policies in appropriate security Issues	Apply
CO 3:Analyze security threats in Wireless networks and find a suitable countermeasure.	Analyze
CO 4: Develop security protocols for a real time scenario.	Create

Course Code: 24COE007	Course Title: RF Advanced Transceiver Design		
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3:0:0	Credits:3	Total Contact Hours:45	Max Marks:100

Course Objectives:

The course is intended to impart knowledge on design topologies and techniques of RF Transceiver design for wireless applications

Module I

22 Hours

Basic Concepts in RF Design: General Considerations-Effects of Nonlinearity-Harmonic Distortion-Gain Compression-Cross Modulation-Intermodulation-Cascaded Nonlinear Stages-Noise: Noise as a Random Process-Noise Spectrum-Effect of Transfer Function on Noise-Device Noise-Sensitivity and Dynamic Range-Passive Impedance Transformation-MOS models for RF, Characteristics of passive IC components at RF frequencies – interconnects, resistors, capacitors, inductors and transformers

Transceiver Architectures: Receiver Architectures-Basic Heterodyne Receivers-Modern Heterodyne Receivers-Direct-Conversion Receivers-Image-Reject Receivers-Low-IF Receivers. Transmitter Architectures-Direct-Conversion Transmitters-Modern Direct-Conversion Transmitters-Heterodyne Transmitters

Low Noise Amplifier: LNA Topologies-Gain Switching-Band Switching, Design of LNA using Keysight ADS

Module II

23 Hours

Power Amplifier: Stability of feedback systems: Gain and phase margin, Root-locus techniques, Time and Frequency domain considerations, Compensation, Class A, AB, B, C, D, E and F amplifiers, Analysis of Power amplifier using Keysight ADS

Phase-Locked Loop and Mixers: Resonant LC-CMOS VCO design, Other VCO topologies: QVCOs Linearized PLL Model, Loop filters and Charge pumps, Integer-N frequency synthesizers, Direct Digital Frequency Synthesizers Active mixers, Passive and polyphaser filters

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Analyze the challenges in Circuit design based on noise figure, Conversion gain and implementation in CMOS technology	Analyze
CO 2: Analyze the different transceiver architectures for wireless applications	Analyze
CO 3: Design and Implementation of Low Noise Amplifier based on foundry models for Wireless Communication Systems	Apply
CO 4: Design and Implementation of Power amplifier for portable applications	Apply
CO 5: Design and analyze different types of Phase Locked Loops and mixers for wireless applications	Apply

Course Code: 24COE008		Course Title: VLSI Signal Processing	
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3:0:0	Credits: 3	Total Contact Hours: 45	Max Marks: 100

Course Objectives:

The course is intended to impart knowledge on the concepts of pipelining and parallel processing, algorithmic level transformation techniques in VLSI design and algorithmic level strength reduction techniques in filters. This course is intended to explain scaling, round-off noise and design bit level arithmetic architectures, synchronous and wave pipelined architectures.

Module I

23 Hours

Pipelining and Parallel Processing : Introduction to DSP Systems- Typical DSP Algorithms, Data flow and Dependence graphs-critical path, Loop bound, iteration bound, Longest path matrix algorithm, Pipelining and Parallel processing of FIR filters- Application in simple architectures, Pipelining and parallel processing for low power.

Algorithmic Level Transformation Techniques and Algorithmic Level Strength Reduction fast Convolution : Retiming-definitions and properties, Techniques : Unfolding — an algorithm for unfolding, properties of unfolding, sample period reduction and parallel processing application: Folding — folding transformation, Register minimization technique, Folding of multirate systems, Fast Convolution- Cook-Toom Algorithm, Algorithmic strength reduction in filters and transforms, 2-parallel FIR filter, DCT Architecture, Pipelined and parallel recursive filters, Look-Ahead pipelining in first-order IIR filters, Parallel processing of IIR filters, combined pipelining and parallel processing of IIR filters.

Module II

22 Hours

Scaling and Round off Noise and Bit-Level Arithmetic Architectures : Scaling and Round off noise, state variable description of digital filters, Bit-level arithmetic architectures – parallel multipliers with sign extension, parallel carry-ripple and carry-save multipliers, Design of Lyon’s bit-serial multipliers using Horner’s rule, bit-serial FIR filter, CSD representation, CSD multiplication using Horner’s rule for precision improvement; Distributed arithmetic.

Numerical Strength Reduction, Wave and Asynchronous Pipelining : Numerical strength reduction- sub expression elimination, multiple constant multiplication, iterative matching, synchronous pipelining and clocking styles, clock skew in edge-triggered single phase clocking, two-phase clocking, wave-pipelining, Asynchronous pipelining bundled data versus dual rail protocol.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1: Utilize the concepts of pipelining and parallel processing to design VLSI architectures for DSP algorithms.	Apply
CO2: Analyze algorithmic level transformation techniques for DSP sub-systems and algorithmic level strength reduction techniques for filters.	Analyze
CO3: Construct scaling, round-off noise and design bit level arithmetic architectures.	Apply
CO4: Examine the concepts in numerical strength reduction, asynchronous and wave pipelined architectures.	Analyze

Course Code: 24COE009	Course Title: Deep Learning in Computer Vision		
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3 : 0 : 0	Credits: 3	Total Contact Hours: 45	Max Marks:100

Course Objectives:

The course is intended to impart knowledge on fundamental concepts of deep learning and its applications in the field of computer vision. This course also enables the students to implement deep learning architectures for real-world applications.

Module I

22 Hours

Overview of Computer vision and Deep learning: Introduction to Image Formation, Capture and Representation; Linear Filtering, Correlation, Convolution, Visual Features and Representations: Edge, Blobs, Corner Detection; Scale Space and Scale Selection; Visual Matching: Bag-of-words, VLAD; RANSAC, Hough transform; Pyramid Matching; Optical Flow. Deep Learning Review: Review of Deep Learning, Multi-layer Perceptrons, Introduction to CNNs; Back propagation Through the Pooling Layers. Dropout Layers and Regularization. Batch Normalization. Various Activation Functions, Various Optimizers, Evolution of CNN Architectures.

Module II

23 Hours

Deep Learning Models: CNNs for Recognition and Verification (Siamese Networks, Triplet Loss, Contrastive Loss, Ranking Loss); CNNs for Detection: Background of Object Detection, R-CNN, Fast R-CNN, Faster R-CNN, YOLO, CNNs for Segmentation: FCN, SegNet, U-Net. Recurrent Neural Networks (RNNs): Review of RNNs; CNN + RNN Models for Video Understanding: Spatio-temporal Models, Spatial Transformers; Transformer Networks, GANs, VAEs, PixelRNNs, NADE, CycleGANs, Progressive GANs, StackGANs, Recent Trends: Zero-shot, One-shot, Few-shot Learning; Self-supervised Learning; Reinforcement Learning in Vision.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1. Identify basic concepts, terminology, models, and methods in the field of computer vision and deep learning.	Understand
CO2. Analyse the Deep Learning algorithms to solve various types of learning tasks and Computer Vision tasks.	Analyze
CO3. Apply the knowledge of transfer learning in the deep learning model for feature extraction, segmentation, detection and Classification applications.	Apply
CO4. Design deep learning architectures for real time applications using different hyper parameters.	Create
CO5. Implement Deep Learning Technique for computer vision applications and present a technical report.	Evaluate

Course Code: 24COE010	Course Title: VLSI for Wireless Communication		
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3:0 :0	Credits:3	Total Contact Hours: 45	Max Marks:100

Course Objectives:

The course is intended to impart knowledge on the concepts of Wireless Communication. It also helps students to design various circuits used in transmitters and receivers.

Module I

23 Hours

Wireless Communication Concepts: Introduction – Overview of Wireless systems – Standards – Access Methods – Modulation schemes – Classical channel – Wireless channel description – Path loss – Multipath fading – Standard Translation. Transmitter back end design – Quadrature LO generator. Receiver front end – Filter design – Non-idealities – Design parameters – Noise figure & Input intercept point. LNA Introduction – Wideband LNA design – Narrow band LNA design: Impedance matching & Core amplifier. Power amplifier design.

Module II

22 Hours

Transmitter and Receiver Circuits: Balancing Mixer - Qualitative Description of the Gilbert Mixer - Conversion Gain – Distortion – Noise - A Complete Active Mixer. Switching Mixer – Distortion, Conversion Gain & Noise in Unbalanced Switching Mixer - A Practical Unbalanced Switching Mixer. Sampling Mixer - Conversion Gain, Distortion, Intrinsic & Extrinsic Noise in Single Ended Sampling Mixer. PLL – Phase detector – Dividers – Voltage Controlled Oscillators – LC oscillators – Ring Oscillators – Phase noise – Loop filters & design approaches – A complete synthesizer design example (DECT) – Frequency synthesizer with fractional divider.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1: Understand the various terms and concepts of Wireless communication	Understand
CO2: Analyze the channel for wireless communication with various modulation schemes	Analyze
CO3: Design various circuits such as filters, amplifiers, oscillators, mixers for Wireless Communication System.	Create
CO4: Work effectively in teams to design and develop various circuits used for Wireless Communication System using appropriate simulation tool	Evaluate

Course Code: 24COE011		Course Title: Pattern Recognition and Machine Learning	
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3: 0: 0	Credits:3	Total Contact Hours:45	Max Marks:100

Course Objective:

The course is intended to impart knowledge, apply and analyze pattern recognition, neural network, algorithm independent machine learning, CNN and also unsupervised learning and clustering concepts.

Module I

23 Hours

Pattern Recognition and Neural Network: Problems, applications, design cycle, learning and adaptation, examples, Probability Distributions, Parametric Learning - Maximum likelihood and Bayesian Decision Theory- Bayes rule, discriminant functions, loss functions and Bayesian error analysis. Linear Models for Regression, linear regression, logistic regression Linear Models for Classification. Introduction to Neural Network – perceptron, multi-layer perceptron, back propagation algorithm, error surfaces, practical techniques for improving back propagation, Support vector machine.

Module II

22 Hours

Machine Learning: Lack of inherent superiority of any classifier, bias, and variance, re-sampling for classifier design, combining classifiers. Unsupervised Bayesian learning, k-means clustering, fuzzy k-means clustering, hierarchical clustering. Deep Learning - Convolution Neural Networks – Recurrent Neural Networks

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1: Explain the basic concepts of pattern recognition methods.	Understand
CO2: Classify the given data using the linear programming techniques and neural networks.	Apply
CO3: Analyze the unsupervised learning techniques and clustering.	Analyze
CO4: Work effectively in teams to develop a suitable CNN for the given problem.	Evaluate

Course Code: 24COE012		Course Title: Cognitive Radio	
Course Category: PEC		Course Level: Major	
L:T:P(Hours/Week) 3:0:0	Credits:3	Total Contact Hours:45	Max Marks: 100

Course Objectives:

The course is intended to impart knowledge on the basics of Software Defined Radio, Cognitive Radio architecture, their technologies and analyze the impact of interference in Cognitive Radio.

Module I

22 Hours

Signal Processing and Digital Synthesis for SDR: Filter banks-uniform filter bank. Direct and DFT approaches. Introduction to ADSL Modem. Discrete multitone modulation and its realization using DFT. QMF - STFT. Computation of DWT using filter banks. DDFS - ROM LUT approach. Spurious signals jitter. Computation of special functions using CORDIC. Vector and rotation mode of CORDIC.CORDIC architectures.

Module II

23 Hours

Software Defined and Cognitive Radio Architectures: Block diagram of a software radio. Digital down converters and demodulators Universal modulator and demodulator using CORDIC. Incoherent demodulation - digital approach for I and Q generation, special sampling schemes. CIC filters. Residue number system and high speed filters using RNS. Down conversion using discrete Hilbert transform. Under sampling receivers, Coherent demodulation schemes. Concept of Cognitive Radio, Benefits of Using SDR, Problems Faced by SDR, Cognitive Networks, Cognitive Radio Architecture. Cognitive Radio Design, Cognitive Engine Design. A Basic OFDM System Model, OFDM based cognitive radio, Cognitive OFDM Systems, MIMO channel estimation, Multi-band OFDM, MIMO-OFDM synchronization and frequency offset estimation. Spectrum Sensing to detect Specific Primary System, Spectrum Sensing for Cognitive OFDMA Systems.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Understand uniform filter banks, DFT-based modulation (DMT), QMF, STFT, DWT computation, and the basics of DDFS and SDR.	Understand
CO 2: Implement and simulate a DDFS using a ROM LUT to generate a sinusoid and analyze spurious signals.	Apply
CO 3: Analyze the SDR receiver architecture, including digital down conversion, demodulation (including CORDIC), and challenges in coherent/incoherent demodulation and sampling.	Analyze
CO 4: Analyze Cognitive Radio concepts, architecture, design considerations, and its integration with OFDM, including spectrum sensing.	Analyze
CO 5: Analyze the challenges in real world spectrum sensing scenarios and make an oral presentation individually or team. (for internal assessment only)	Analyze

Course Code: 24COE013		Course Title: EMI and EMC	
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3: 0: 0	Credits:3	Total Contact Hours:45	Max Marks:100

Course Objective:

The course is intended to impart knowledge, apply and analyze EMI/EMC concepts, EMI coupling and control techniques, EMC design of PCBs, EMI measurements and standards.

Module I

23 Hours

Concepts, Coupling and Control techniques: EMI-EMC definitions and Units of parameters - Sources and victim of EMI- Conducted and Radiated EMI Emission and Susceptibility - Transient EMI, ESD - Radiation Hazards. Conducted, radiated and transient coupling - Common ground impedance coupling - Common mode and ground loop coupling - Differential mode coupling - Near field cable to cable coupling, cross talk; Field to cable coupling; Power mains and Power supply coupling. Shielding – Filtering – Grounding – Bonding - Isolation transformer - Transient suppressors – Cable Routing - Signal control.

Module II

22 Hours

EMC Design of PCBs and EMI Measurements: Component selection and mounting - PCB trace impedance – Routing - Cross talk control - Power distribution decoupling – Zoning – Grounding - VIAs connection – Terminations. Open area test site -TEM cell - EMI test shielded chamber and shielded ferrite lined anechoic chamber - Tx /Rx Antennas – Sensors- Injectors / Couplers and coupling factors - EMI Rx and spectrum analyzer - Civilian standards-CISPR, FCC, IEC, EN; Military standards-MIL461E/462.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1: Explain the concept of EMI / EMC related to product design & development.	Understand
CO2: Analyze the different EM coupling techniques and its impact on performance of electronic system.	Analyze
CO3: Apply various EM compatibility issues with regard to the design of PCBs and ways to improve the overall system performance	Apply
CO4: Work effectively in teams to analyze the various EM radiation measurement techniques and the present leading edge industry standards in different countries	Evaluate

Course Code: 24COE014	Course Title: Remote Sensing		
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3:0 :0	Credits:3	Total Contact Hours: 45	Max Marks:100

Course Objectives:

The course is intended to impart knowledge on the concepts of Remote sensing, Data Acquisition and remote sensing platforms. It also helps students to analyze Thermal and Hyper spectral images and different data analysis techniques.

Module I

23 Hours

Data Acquisition and Hyper Spectral Remote sensing: Electro Magnetic Spectrum - Physics of Remote Sensing-Effects of Atmosphere-Scattering–Different types–Absorption-Atmospheric window-Energy interaction with surface features –Spectral reflectance of vegetation, soil and water atmospheric influence on spectral response patterns-multi concept in Remote sensing. Types of Platforms–different types of aircrafts-Manned and Unmanned space crafts–sun synchronous and geo synchronous satellites –Types and characteristics of different platforms –LANDSAT, SPOT, IRS, INSAT, IKONOS, QUICKBIRD. Sensors characteristics-principle of spectroscopy imaging spectroscopy–field conditions. compound spectral curve. Spectral library. radiative models. processing

Module II

22 Hours

Remote Sensing platforms and Data Analysis: Thermal remote sensing –thermal sensors, principles, thermal data processing, applications. Microwave scatterometry, types of RADAR –SLAR –resolution –range and azimuth –real aperture and synthetic aperture RADAR. Characteristics of Microwave images topographic effect-different types of Remote Sensing platforms –airborne and space borne sensors -ERS, JERS, RADARSAT, RISAT - Scatterometer, Altimeter-LiDAR remote sensing, principles, applications. Resolution–Spatial, Spectral, Radiometric and temporal resolution-signal to noise ratio-data products and their characteristics-visual and digital interpretation–Basic principles of data processing –Radiometric correction–Image enhancement–Image classification–Principles of LiDAR, Aerial Laser Terrain Mapping.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1: Understand the various concepts of Remote sensing.	Understand
CO2: Analyze the various data acquisition systems for satellites.	Analyze
CO3: Analyze the thermal and hyper spectral images in the appropriate platforms	Apply
CO4: Work effectively in teams to apply the various data analytics tool for the given scenario.	Evaluate

Course Code: 24COE015		Course Title: Millimeter Waves and Tera Hertz Communication Systems	
Course Category: PEC		Course Level: Mastery	
L:T:P(Hours/Week) 3:0:0	Credits:3	Total Contact Hours:45	Max Marks:100

Course Objectives:

The course is intended to impart knowledge on the principles and challenges of millimeter wave and terahertz frequency band communications. It also helps the students to explore propagation characteristics, devices, and antenna design for mmWave/THz systems, analyze architectures and system-level considerations in mmWave and THz networks and evaluate emerging applications and future research directions.

Module I

22 Hours

Propagation, Channel Modeling and Components: Spectrum allocation and regulatory issues - Characteristics of Millimeter wave and THz bands - Advantages and limitations – Emerging applications: 5G/6G, IoT, imaging, sensing. Atmospheric absorption and attenuation - Scattering, diffraction, and reflection at mmWave/THz frequencies - Path loss models - Channel modeling approaches - statistical, ray-tracing - MIMO channel characteristics. Sources and detectors for Millimeter wave and THz - photonic sources, Schottky diodes - Amplifiers and mixers - Modulators/demodulators - Silicon and III-V technologies – Design considerations and Integration challenges

Module II

23 Hours

Antennas and Arrays and System Design: Antenna requirements at high frequencies - Microstrip, slot, and leaky-wave antennas - Phased arrays and beamforming - Lens and reflect array antennas – mmWave and THz MIMO and reconfigurable intelligent surfaces (RIS) – Design of mmWave and THz antenna systems using the simulation tool. Link budget analysis - MAC and PHY layer design for mmWave/THz - 5G/6G system integration - Security and reliability considerations. Case studies: indoor communication, vehicular networks, THz wireless backhaul.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO1: Analyze the propagation behavior of mmWave and THz signals to characterize complex wireless channels.	Apply
CO2: Analyze the societal, health and regulatory implications of deploying mmWave and THz communication systems	Analyze
CO3: Design high-frequency antenna systems to meet performance requirements for 5G/6G and real world IoT applications.	Create
CO4: Simulate and conduct experiments in teams involving the design of mmWave and THz systems with state-of-the-art tools.	Evaluate

OPEN ELECTIVES

Course Code: 24COO301		Course Title: Network Security	
Course Category: Open Elective		Course Level: Mastery	
L:T:P(Hours/Week) 3: 0: 0	Credits: 3	Total Contact Hours: 45	Max Marks: 100

Course Objectives:

The course is intended to impart knowledge on the concepts of public key cryptosystem with key exchange algorithm. It also helps students to choose an appropriate authentication algorithm for a given application and to distinguish among different types of threats to the system and to handle them.

Module 1

22 Hours

Security and Cryptography: Need, security services, Attacks, OSI Security Architecture, one time passwords, Model for Network security, Classical Encryption Techniques like substitution ciphers, Transposition ciphers, Cryptanalysis of Classical Encryption Techniques, Hands on practice. Introduction, Fermat's and Euler's Theorem, The Chinese Remainder Theorem, Euclidean Algorithm, Extended Euclidean Algorithm, and Modular Arithmetic. Block Ciphers, Stream Ciphers, RC4 Stream cipher, Data Encryption Standard (DES), Advanced Encryption Standard (AES), Triple DES.

Module II

23 Hours

Authentication and System security: RSA, Key Distribution and Management, Diffie-Hellman Key Exchange, Elliptic Curve Cryptography, Message Authentication Code, hash functions, message digest algorithms: MD4 MD5, Secure Hash algorithm, RIPEMD-160, HMAC. IP and Web Security Digital Signatures, Digital Signature Standards, Authentication Protocols, Kerberos, IP security Architecture, Encapsulating Security Payload, Key Management, Web Security Considerations, Secure Socket Layer and Transport Layer Security, Secure Electronic Transaction. Intruders, Intrusion Detection, Password Management, Worms, viruses, Trojans, Virus Countermeasures, Firewalls, Firewall Design Principles, Trusted Systems.

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1: Identify and utilize different forms of cryptography techniques.	Apply
CO 2: Analyze the mathematics behind cryptography and various intrusion detection techniques	Analyze
CO 3: Choose an appropriate authentication algorithm for a given application	Apply
CO 4: Work effectively in teams to apply the various authentication algorithm in real time for System Security	Apply

Course Code: 24COO302		Course Title: Advanced Embedded Systems	
Course Category: Open Elective		Course Level: Mastery	
L:T:P(Hours/Week) 3: 0: 0	Credits: 3	Total Contact Hours: 45	Max Marks: 100

Course Objectives:

The course aims to provide an in-depth understanding of embedded systems, including the design and development of both hardware and software components. Students will gain knowledge in memory management, sensor integration, actuator control, and real-time operating system (RTOS) concepts. The course will cover hardware-software co-design, firmware development, and debugging techniques in embedded environments.

Module 1

22 Hours

Core of the embedded system, Memory, Sensors and Actuators, Commutation interface, Embedded firmware, Other system components. Characteristics and quality attribution of Embedded Systems. Fundamental issues in hardware software co-design, Computational models in embedded design, Introduction to Unified modelling language, Hardware software trade-off.

Embedded firmware design approaches, Embedded firmware development language. Real time operating system (RTOS) based embedded system design: Operating system basics, Types of OS, Tasks, Process and threads, Multiprocessing and multitasking, Task scheduling.

Module II

23 Hours

Threads, Processing and scheduling: Putting them altogether, Task communication, task synchronization, Device drivers, How to choose an RTOS The Integrated development environment (IDE), Types of files generated on cross compilation, Disassembler/Decompilers, Emulators and debugging, Target hardware debugging, Boundary scan. Processor trends in embedded system, Embedded OS trends, development language trends Open standards, Frameworks and alliances, Bottlenecks

Course Outcomes	Cognitive Level
At the end of this course, students will be able to:	
CO 1. Apply RTOS concepts to manage tasks, processes, and threads in embedded systems, ensuring real-time performance.	Apply
CO 2: Analyze hardware and software trade-offs and make decisions on partitioning functionality between hardware and software based on system constraints.	Analyze
CO 3: Develop embedded firmware using embedded programming languages (C, C++) and debugging tools, ensuring efficient and reliable operation.	Create
CO 4: Work effectively in teams to Design and implement embedded systems with appropriate memory management, sensor integration, and actuator control for a given application.	Evaluate
