A hybrid convolutional neural network–bidirectional long short-term memory–attention framework for carbon price forecasting with residual error correction

Ponnusamy Vetrivelan*, Selligoundanur Subramaniam Sivaraju, Anuradha Thangavelu, Senthil Kumar Angappan, Sivaganesan Dhandapani, and Shuriya Balusamy

Abstract

Carbon trading markets are important mechanisms for reducing greenhouse gas emissions; however, carbon prices are highly volatile due to the influence of energy markets, economic conditions, regulatory policies, and investor sentiment. This study proposes a hybrid machine learning and natural language processing (ML–NLP) framework for interval-based carbon price forecasting by integrating structured market indicators with sentiment features extracted from financial news, policy announcements, and market discussions. The proposed model combines convolutional neural networks, bidirectional long short-term memory networks, and an attention mechanism to capture complex temporal dependencies and feature interactions, along with a residual error correction module to improve forecasting accuracy. The framework is evaluated using real-world European Union and China Emission Trading Systems carbon allowance price datasets. The results demonstrate that the proposed approach effectively captures nonlinear carbon market patterns and improves prediction performance, reducing mean absolute error from 2.84 €/tCO$_2$ to 1.76 €/tCO$_2$ after residual correction. The findings confirm that integrating deep learning, sentiment analysis, and residual learning provides an effective approach for reliable carbon price forecasting.

Summary

Hybrid Swarm Intelligence has emerged as a powerful computational paradigm for solving complex optimization problems in decision-making and robotics. Traditional swarm intelligence techniques, such as Particle Swarm Optimization (PSO) and Ant Colony Optimization (ACO), have demonstrated efficiency in global search and optimization tasks. However, their limitations, including slow convergence, premature stagnation, and suboptimal decision-making in high-dimensional environments, necessitate hybridized approaches. This chapter introduces an advanced Hybrid Swarm Intelligence framework that integrates Multi-Swarm Optimization (MSO) and Quantum-Inspired Swarm Intelligence (QPSO) to enhance adaptability, precision, and computational efficiency. By leveraging multi-swarm communication strategies, the proposed approach ensures a more diverse exploration-exploitation balance, overcoming the local minima problem prevalent in traditional models.

By embedding quantum-inspired strategies, the search process adopts a probabilistic expansion that empowers agents to navigate vast, high-dimensional solution spaces far more effectively. This chapter then examines the synergy of hybrid swarm intelligence in

An open-set hybrid CNN-TCN network for human action recognition with unknown action rejection in collaborative robot workspaces

Yasir Abdullah R[1], Ignisha Rajathi G[2]*, Barakkath Nisha U[3] and Johny Elton R[4]

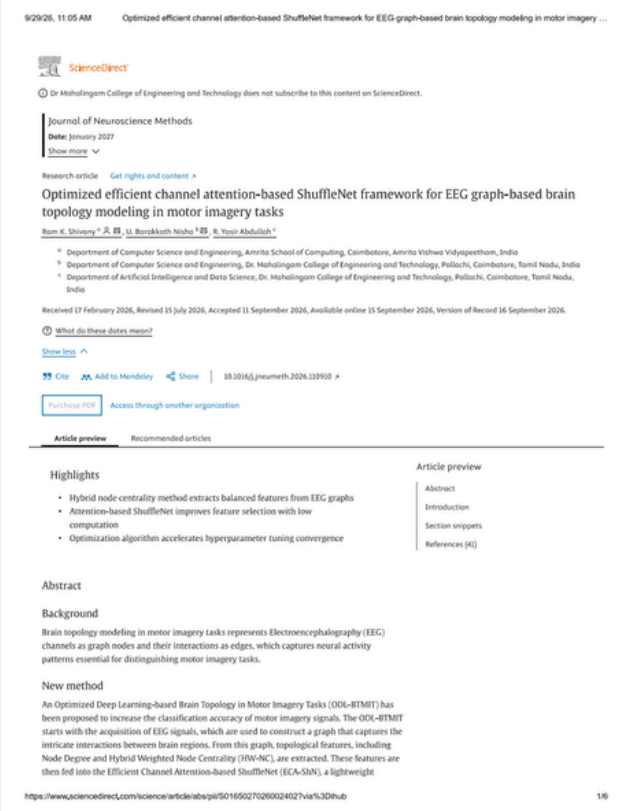

Introduction: Open-set recognition capability is becoming necessary for collaborative robots because actual shop-floor dynamics do not always correspond to the fixed action classes used during training. Misclassification of unknown human motions may lead to inappropriate robot responses, whereas reliable rejection enables safer supervisory control.
Methods: An open-set human action recognition framework is developed by combining a spatial Convolutional Neural Network encoder with a Temporal Convolutional Network-based temporal aggregation module and an unknown-action rejection gate based on open-set scoring. The framework is evaluated on the NTU RGB+D 120 dataset using cross-subject and cross-view protocols with held-out action classes.
Results: The proposed framework achieves 93.20% and 91.00% top-1 accuracy under cross-subject and cross-view evaluation, respectively, with corresponding Macro-F1 scores of 88.40% and 86.20%. For open-set detection, it achieves an AUROC of 0.938 and an AUPR of 0.750, with a 5.00% false acceptance rate for unknown actions and a 91.82% true known-action acceptance rate. The system operates at 15.0 ms per window and 66 fps on an NVIDIA Jetson Orin NX 16 GB, with a model size of 42 MB.
Discussion: The results demonstrate that calibrated unknown-action rejection can improve safety-aware human action recognition while retaining practical real-time performance for collaborative robot workspaces.

1 Introduction

The capability to predict human actions and the ability to detect unexpected events in which an action performed by the human differs from the known set of behaviours are required in terms of safety. Current collaborative safety-aware assembly work has already made this link between the task context and the risk-aware robot motion

Abstract

Background

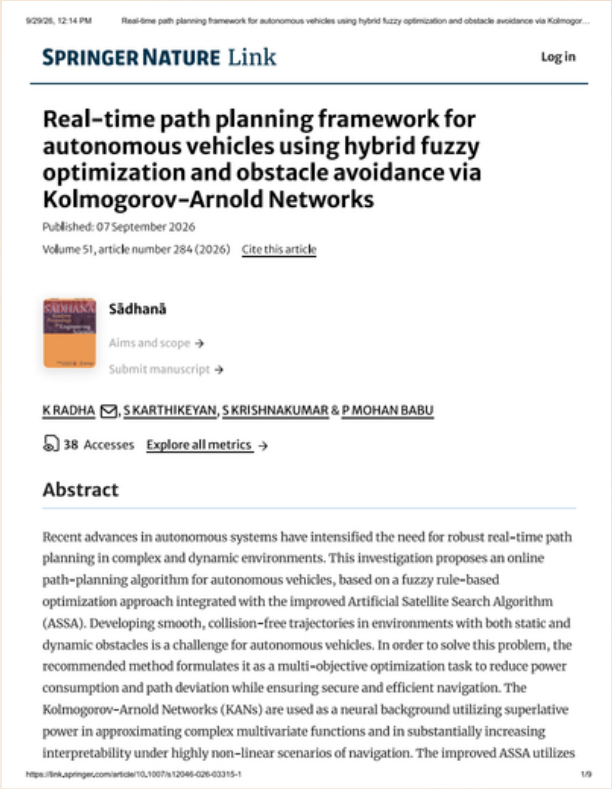

Brain topology modeling in motor imagery tasks represents Electroencephalography (EEG) channels as graph nodes and their interactions as edges, which captures neural activity patterns essential for distinguishing motor imagery tasks.

New method

An Optimized Deep Learning-based Brain Topology in Motor Imagery Tasks (ODL-BTMIT) has been proposed to increase the classification accuracy of motor imagery signals. The ODL-BTMIT starts with the acquisition of EEG signals, which are used to construct a graph that captures the intricate interactions between brain regions. From this graph, topological features, including Node Degree and Hybrid Weighted Node Centrality (HW-NC), are extracted. These features are then fed into the Efficient Channel Attention-based ShuffleNet (ECA-ShN), a lightweight

Abstract

Recent advances in autonomous systems have intensified the need for robust real-time path planning in complex and dynamic environments. This investigation proposes an online path-planning algorithm for autonomous vehicles, based on a fuzzy rule-based optimization approach integrated with the improved Artificial Satellite Search Algorithm (ASSA). Developing smooth, collision-free trajectories in environments with both static and dynamic obstacles is a challenge for autonomous vehicles. In order to solve this problem, the recommended method formulates it as a multi-objective optimization task to reduce power consumption and path deviation while ensuring secure and efficient navigation. The Kolmogorov-Arnold Networks (KANs) are used as a neural background utilizing superlative power in approximating complex multivariate functions and in substantially increasing interpretability under highly non-linear scenarios of navigation. The improved ASSA utilizes

Abstract: Crop selection under climatic and agronomic uncertainty is a multi-criteria decision-making (MCDM) problem for which classical, deterministic approaches are poorly suited, as they cannot represent the indeterminacy inherent in field data. This study proposes a Neutrosophic Entropy–PROMETHEE (NE-PROMETHEE) framework that combines single-valued neutrosophic sets, for representing truth, indeterminacy, and falsity membership in criteria evaluations, with an entropy-based weighting scheme for deriving objective, data-driven criteria weights, free of subjective bias. The framework is applied to six crops (Cotton, Rice, Barley, Soybean, Wheat, and Maize) evaluated against four criteria: rainfall, temperature, days to harvest, and yield per hectare. Theoretical analysis establishes boundedness and flow conservation of the net outranking flow, Lipschitz stability of the ranking under data perturbation, consistency with Pareto dominance, and invariance under admissible rescaling of criteria and preference functions, providing formal guarantees rarely established for neutrosophic MCDM methods. Empirically, the framework identifies Rice as the top-ranked crop, followed by Maize, owing to Rice's dominant pairwise outranking performance. The resulting ranking is validated against six established MCDM benchmarks (TOPSIS, VIKOR, SAW, WPM, MARCOS, and MADM), yielding Spearman rank correlations of $\rho \geq 0.89$ (up to $\rho = 1.00$) and concordant Kendall's τ statistics, confirming strong agreement. A comparison against six machine-learning surrogates (Random Forest, XGBoost, CatBoost, LightGBM, SVM, and a Deep Neural Network) under leave-one-out cross-validation shows that data-hungry learning models fail to reproduce the ranking reliably on this small-alternative-set problem, underscoring the practical advantage of the proposed deterministic, formally-grounded framework for real-world precision-agriculture decision support.

1. Introduction

Agriculture remains a cornerstone of the global economy and, in developing nations such as India, a primary source of livelihood for a substantial share of the population. Selecting the most suitable crop for a given region is consequently a critical decision-making task that must jointly account for multiple, often conflicting, factors rainfall, temperature, growth duration, and yield each of which is subject to climatic variability and measurement uncertainty. Classical, deterministic crop selection approaches, which rely on statistical analysis and presuppose precise input data,

(57) Abstract :
Credit card payments have become one of the most common ways to make financial transactions due to the rapid increase in digital banking, internet shopping, mobile payments and contactless transactions. The growth, however, comes at a cost as financial fraud is becoming more advanced and thus transaction security has become one of the primary concerns for banks, merchants and consumers. Current fraud detection services largely rely on pre-determined rules, static security policies or few transaction attributes to detect anomalies. While these methods can catch specific frauds, they often do not recognize novel orders that have recently arrived, leading to detection delays as well as the needless blocking of legitimate transactions—both creating customer annoyance. Current systems also tend to work in silos, not leveraging the massive amount of information that is generated via connected payment devices, cloud platforms and customer behaviour over time, handcuffing their ability to perform intelligent and adaptive fraud prevention. Accordingly, the present invention is concerned with a Cloud-IoT Integrated Machine Learning Framework for Real-Time Credit Card Fraud Detection and Secure E-Commerce Transaction Authentication which provides an all-in-one framework that integrates cloud computing, IoT-enabled payment infrastructure, behavioral feature engineering, machine learning and adaptive authentication. The system always collects data about transactions from banking systems, payment gateways, merchant platforms, customer devices, and terminals for contactless payments. The data collected is then distilled into useful behavioral parameters such as the Transaction Trust Score (TTS), User Behavioural Consistency Index (UBCI), Device Reliability Factor (DRF) Location Confidence Score (LCS) and Dynamic Fraud Risk Index (DFRI). Through a machine learning prediction engine, these indicators are then processed by the banks to determine fraud probability, detect unusual transaction behavior and aid in making intelligent authentication decisions. The framework also emphasizes the utilization of features such as monitor them in real time, receive fraud alerts, offer adaptive authentication solutions and continuously adapt to new patterns with machine learning algorithms that yields better detection performance when more information about the transactions becomes available. With this invention, businesses can expect improvements in transaction security, reduction in erroneous decline of legitimate transactions, improved fraud detection performance, and building stronger customer trust; as well as a scalable digital payment ecosystem to be merged into future eCommerce platforms.
